

SOC Alert Simulation Report

1. Incident Overview

During security log analysis on a Windows system, multiple failed login attempts were detected, indicating a potential unauthorized access attempt.

2. Objective

To simulate failed login attempts and analyze system logs to identify suspicious authentication activity and understand SOC alert handling.

3. Methodology

A controlled simulation was performed by generating failed login attempts on a Windows machine. The generated logs were analyzed using Windows Event Viewer under Security logs.

4. Observations

- A total of **5 failed login attempts** were recorded.
- All events correspond to **Event ID 4625 (Failed Login)**.
- Logs show repeated login failures within a short time period.
- The system recorded these events under audit failure logs.

5. Identified Issue

The repeated failed login attempts indicate a **brute force attack pattern**, where multiple incorrect passwords are used to gain access to an account.

6. Affected System

- System Type: Windows Machine
- Computer Name: DESKTOP-HSEMTIT
- Log Source: Windows Security Logs

7. Evidence

- Event ID: 4625 (Audit Failure)
- Number of Attempts: 5
- Log Message: "An account failed to log on"
- Source: Microsoft Windows Security Auditing
- Timestamp: Multiple entries within a short duration

8. Impact Analysis

- Risk of unauthorized access if attack succeeds
- Potential account compromise
- Indicates vulnerability to password-based attacks

9. Response Strategy

- Temporarily lock the affected account
- Enforce strong password policies
- Enable Multi-Factor Authentication (MFA)
- Monitor login attempts continuously
- Investigate and block suspicious sources

10. Conclusion

The analysis confirms a simulated **brute force attack scenario** based on repeated failed login attempts (Event ID 4625). This demonstrates how Security Operations Center (SOC) analysts detect and respond to authentication-based threats using log analysis.
