

Log Investigation Report

1. Objective

To analyze Windows security logs and identify failed login attempts and suspicious authentication activity.

2. Log Source

- Tool Used: Windows Event Viewer
- Log Type: Security Logs

3. Findings

- A total of **5 failed login attempts** were detected.
- All events correspond to **Event ID 4625 (Failed Login)**.

- The failed attempts occurred within a short time interval.

4. Suspicious Activity

The repeated failed login attempts within a short period indicate **suspicious login behavior**.

Such patterns are commonly associated with a **brute force attack**, where multiple incorrect passwords are attempted to gain access.

5. Analysis

- All failed attempts were recorded on the same system.
- Rapid repeated login failures were observed.
- No successful login (**Event ID 4624**) was detected after the failed attempts.

6. Conclusion

The log analysis identified multiple failed login attempts and suspicious activity consistent with a **brute force attack pattern**. The attack was unsuccessful as no valid login occurred.

7. Recommendations

- Enable account lockout policies
- Use strong passwords
- Enable Multi-Factor Authentication (MFA)
- Continuously monitor login activity
